

Forms of water

The word “form” could be replaced with the more scientific terms of “state” or “phase” that is, from i.e solid to liquid to gas.

Water pathways

When water vapour, rain, hail or snow makes contact with the surface of the earth it follows many different pathways.

Water storage

Liquid water is stored in different parts of the land surface, some are natural structures, other are man-made.

Water use

We extract water from water storages and use it in many different ways.

Discarding water

Once we have used water we get rid of the excess or the polluted water in a number of different ways.

Product

The used and discarded water may immediately complete the water cycle by becoming water vapour or it may be stored in liquid form until it is reprocessed by evaporation or treatment of various kinds for example filtration.
